

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

various chapters and the book will well repay a careful perusal by all concerned with bird conservation. One point is especially worthy of consideration by game commissioners, who in spite of the evidence in favor of most hawks and owls are still inclined to recommend their unlimited slaughter, along with all other vermin, on game preserves, on account of their destruction of a certain number of game birds. Mr. Pearson cites a case in which such slaughter was carried on most thoroughly for the sake of protecting a large preserve of English Pheasants. The birds were later almost wiped out by disease and he says: "Is it going too far to say that the gunmen and trappers had over done their work? So few Hawks or Owls or foxes had been left to capture the birds first afflicted, that these had been permitted to associate with their kind and to pass on weakness and disease to their offspring until the general health tone of the whole Pheasant community had become lowered." All animals, as Mr. Pearson says, "have their part to play in the great economy of the earth, and it is a dangerous experiment to upset the balance of Nature."—W. S.

Henshaw and Fuertes on North American Warblers.¹—The interest in this publication centers about the thirty-two Warbler pictures in colors reproduced from paintings by Louis Agassiz Fuertes. We have several times had occasion to congratulate the 'National Geographic Magazine' upon the splendid educational work that it is doing, in the publication of these colored pictures illustrating various branches of natural history, and once again we express our appreciation. The present pictures are larger than the former bird series, each one being half, instead of one third the height of the page and this of course presents the work of the artist to much better advantage. Mr. Fuertes has published warbler portraits before, notably the series in 'Bird-Lore' which appeared later in Chapman's 'Warblers' and those in Eaton's 'Birds of New York,' but we think the present figures are better than either, and they will give pleasure to thousands of bird students to whom the warblers are always the favorite group for study. Mr. H. W. Henshaw has written a descriptive text in which are embodied many interesting personal experiences of this veteran ornithologist, while the introductory pages discuss the relationship, migration and economic value of these interesting little birds, while frequent references to the publications of the U. S. Biological Survey enable the reader to follow up the subject at his pleasure.

The only flaw in this admirable publication is the caption to a half tone illustration from Chapman's 'Camps and Cruises,' which is used to fill out p. 303. It depicts an interesting family of young Blue Jays under which has been placed, without the authority of either Mr. Henshaw or Mr. Fuertes, we are sure, the following inscription: "Young Fish-Hawks about to Leave their Nest"! —W. S.
